The Elerium HTML.NET Parser is a powerful and lightweight .NET component that allows you to scan HTML files by using XPath query expressions. Unlike other .NET HTML parsers, the Elerium HTML.NET Parser automatically defines attributes for parsed elements as well as their values. Additionally, the Elerium HTML.NET Parser provides the following features: Scans an HTML file and returns a

hierarchical collection of parsed objects. Calculates the index for found HTML elements. Allows you to customize the parser, for example by controlling its behavior with XPath queries, XPath "pointer" functions, and C# expressions. Verifies every XML document you are trying to parse. Supports HTML documents in different languages: English, Russian, Ukrainian, Persian, and others. Implements Context-Sensitive parsing - supports XPath queries for determining which

elements of a document should be parsed. Supports different XPath query functions as well as the selection of different nodes in a node tree. Supports XPath queries over the document node. Supports XPath queries over attributes and their values. Supports the "i" flag in a selector and the "in" attribute value. Supports the "contains" flag in a selector and the "contains" attribute value. Supports the "not" flag in a selector. Supports the "count" flag in a selector. Supports XML schema validation. Has a

small footprint. Does not work with MSXML. Supports XML namespaces. Scans HTML documents in the HTML version 2.0. Supports HTML documents written in languages other than English. Automatically deletes temporary files. Auto-scans through folders and sub-folders. Supports XPath queries over contexts. Supports path mappings. Supports XPath 2.0: `/path/to/my/xpath/query`. Supports XPath 3.0: `/path/to/my/xpath/query[index('section1')>= 0]`.

Supports XPath 3.0 with an `index('section1')>=0` expression with the `/` character that is also supported by `"section1"` expressions. Supports XPath 3.0 with an implicit relative-locator expression of `"//this/path"`.
