Q: Restrict scroll in flexslider is not working in IE8 I have created a site using Flexslider with Fancybox Plugin and it works great in IE9+ Chrome. However in IE8 and IE7 the live demo doesn't work. It works if I turn on the restriction button but then all the images are behind each other. I'm guessing that the problem is in the CSS for the restrictions button. Here is the link to the live site. $('.flex-nav').flexSlider({

An ink jet printhead may include a plurality of nozzles for ejecting ink. In other words, the nozzles may be patterned such that individual ink droplets are ejected. The size of each ink droplet ejected from the printhead is controlled as a function of the ink viscosity and the driving pulse waveform. Water-based ink jet inks typically contain water, coloring agents, and one or more of various additives, including wetting agents, biocides and biostable dispersants. An example of a water-based ink includes the CYCOLOR® Series of inks sold by Seiko Epson Corporation, of America, Inc. and marketed under the trademark CYCOLOR®. Ink-jet inks having low levels of dissolved solids, particularly dissolved salts, are desirable for reasons of environmental protection and reduced costs for filtration and drying ink reservoirs. However, a fundamental problem in ink jet printing with inks having low levels of dissolved solids is how to obtain stable jetting performance under a range of different operating conditions, especially when the inks are used in serial printing applications. The viscosity of ink is also an important parameter that affects the performance of ink jet printers. For example, in high-speed serial printing, inkjet printers are required to maintain accurate ink droplet ejection without loss of jetting efficiency. However, high ink viscosities can cause the printhead to clog, the printhead to heat-up during ejection, and the ink to degrade over time. Many water-based inks have a propensity to gel (i.e., to increase in viscosity as time passes) when exposed to the ambient conditions of the ink reservoir. When the ink does gel, the ink reservoir can be charged with a positive and negative electrical field; as the ink gel shifts around the reservoir, the electrical charge can disrupt printhead operation. Additionally, when ink is within a printhead, the presence of dissolved salts within the ink can also cause the ink to gel. Gels of the
